Key findings from the dashboard

On the line chart for **Sum of Total Sales** according to **Month**, there is a noticeable pattern of sales of products increasing during the months of April, October, and December where sales are the highest. However, there is also a drop in the months of June, September, and November. This pattern shows the inconsistency in sales performance throughout the years 2019-2020, with some months gaining more revenue while the others generate lower sales.

Batteries have the highest number of orders but are the lowest in sales revenue because it's the cheapest among the other products. Meanwhile, laptops have the highest sales, suggesting that despite not being bought as frequently as batteries, they contribute the most to total revenue due to their higher price. This indicates that total revenue is significantly influenced by products with much higher costs than the quantity of orders.

Overall, the dashboard emphasizes the contrast between product demand and contribution to revenue. High-cost products play an important role in total sales performance, despite a significantly higher volume of orders of low-cost items. These findings highlight the relevance of both the amount of sold items and total sales revenue when evaluating business performance.

Identified business issues, trends, or opportunities

There is a fluctuation in sales that is a common problem of businesses. The decline in sales during June, September, and November show a weaker demand on products which creates challenges in maintaining a steady sales performance throughout the year. Such drop in revenue may be caused by minimal marketing activities or lessened consumer spending after peak months.

In the United States, April is a common month for the deadline of tax filing which results in a sudden high volume of consumers buying electronics such as televisions, smartphones, and laptops to make use of the tax return. Also, December is the month where sales are usually at its peak due to gift buying or salary bonuses. However, as mentioned, businesses may experience a decline after high spending periods or consumers might be waiting for holiday deals which causes a delay in purchasing like in November.

In addition, sales are highest on Tuesday and lowest on Thursday which can be because of consumers browsing through products over the weekend and making the purchase early in the weekdays, causing lower engagement in the later days. Furthermore, San Francisco has the highest sales among the cities. Businesses can use these situations as opportunities to introduce more products catering to consumer needs, restock on in-demand products, boost their business

in both high-performing and low-performing locations, create promos to increase sales, especially in computer devices and low-demand products.

Recommended decisions or actions supported by the data

Prioritize inventory allocation for high-performing products such as Batteries and Laptops, as these demonstrate strong demand in terms of quantity ordered and revenue generation. Ensuring sufficient stock levels for these items will help prevent stockouts and maximize sales opportunities. Additionally, marketing efforts should be concentrated on these product types to further strengthen their contribution to overall revenue.

Reevaluate pricing strategies for Dryer and Machines who have low quantity ordered and low sales. Consider implementing discounts, product bundling, or improving product visibility through targeted promotions to enhance performance.

From a geographic perspective, marketing and product strategies should be localized based on city-level performance. Focus on promoting specific product types such as Laptops that perform well in San Francisco. Increase inventory allocation and warehouse support in San Francisco to efficiently meet demand. For Austin, investigate possible factors such as accessibility, pricing sensitivity, or lack of awareness to guide the development of localized promotions, discounts, or advertising campaigns to stimulate demand.

Time-based analysis indicates that certain quarters and months contribute significantly to overall revenue. Evaluate which quarter contributes the highest revenue and prioritize strategic investments during this period. Identify high-performing months such as December and prepare in advance by increasing inventory and strengthening marketing efforts to ensure that the business can fully capitalize on increased demand.
